/dlob_then the library was constructed according
Bonaldo, Lennon and Soares, Genome Research, 6.791-806,
1996. Denatured RNA was size fractionated on a 1% agarose
gel. First strand cDNA synthesis was primed with oligo-dr
primer containing a Not I site. Double strand cDNA was
size selected according to mRNA size fraction, ligated
with EcoR I adaptor, digested with NotI and then cloned
directionally into pXx-Asc vector. The library tag
sequence late not pite in the polyA tail
is ACGGAGACAG. This library was created for the University
lowa Brain Anatomy Project (BMAP): 'Gene Discovery in the
Developing Mouse Nervous System', supported by National
Institute of Mental Health (NIMH), Hemin Chin, Ph.D.,

/mol\_type="mRNA" /strain="C57BL/6"

```
1996. Denatured RNA was size fractionated on a 1% agarose gel. First strand cDNA synthesis was primed with oligo-dr primer containing a Not I site. Double strand cDNA was size selected according to mRNA size fraction, ligated with EcoR I adaptor, digested with NotI and then cloned directionally into pYX-Asc vector. The library tag sequence located between the Not I site and the polyA tail is CAGCACGAC. This library was created for the University lows Brain Anatomy Project (BMAP): 'Gene Discovery in the Developing Mouse Nervous System', supported by National Institute of Mental Health (NIMH), Hemin Chin, Ph.D., program coordinator."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1101

2000-014207/02. WPI; 2000-014207/ N-PSDB; AAZ24475. New nucleic acid encoding a nicotinic acetylcholine receptor from insects, used to identify potential insecticides.

Example la; Page 12-14; 26pp; German.

acetyl-choline receptor (1) from insects which can be used as an insecticide. Inhibitors of (1) interfere with neurotransmission. (1) datso vectors containing it, its regulatory regions, and antibodies distored against (1)-encoded proteins) are used to screen for: (a) plant protection agents that alter conductance of AChR, potentially useful as insecticides, or (b) genes which encode polypeptides that are involved in formation of functionally related AChR in insects. (I) are also used to isolate and characterize the specified regulatory regions and for recombinant production of (II). This sequence represents an acetylcholine receptor isolated from Drosophila melanogaster This invention describes a novel nucleic acid (NA) encoding a nicotinic

This invention describes a novel nucleic acid (NA) encoding a nicotinic acetyl-choline receptor (I) from insects which can be used as an insecticide. Inhibitors of (I) interfere which can be used as an (also vectors containing it, its regulatory regions, and antibodies directed against (I)-encoded proteins) are used to screen for: (a) plant protection agents that alter conductance of ACHR, potentially useful as insecticides, or (b) genes which encode polypeptides that are involved in formation of functionally related ACHR in insects. (I) are also used to recombinant production of (II). This sequence represents an acetyl-choline receptor isolated from Heliothus virescens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       354

The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL06175) and the encoded proteins (ABB5777-ABR7072). The sequence data for this parent did not form part of the printed specification, but was obtained in electronic format directly

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention describes a novel nucleic acid (NA) encoding a nicotinic acety-choline receptor (1) from insects which can be used as an insecticide. Inhibitors of (1) interfere with neurotramsission. (1) (also vectors contraining it, its regulatory regions, and antibodies directed against (1)-encoded proteins) are used to screen for: (a) plant protection agents that alter conductance of Achk, potentially useful as insecticides, or (b) genes which encode polypeptides that are involved in formation of functionally related Achk in insects. (1) are also used to isolate and characterize the specified regulatory regions and for recombinant production of (11). This sequence represents an acetyl-choline receptor isolated from Heliothus virescens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              414
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 NVVVRNNGSCLYVPPGIFKSTCKIDITWFPFDDQRCEMKFGSWTYDGFQLDLQLQDETGG 474

The invention iseful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insectioides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABR3072). The sequence data for this parent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  detection reagent for detecting 1000 or more for elucidating cell signaling and cell-cell

recombinant host cells, pref. a bacterium, and used in the screening of cholinergic agents and other drugs that may affect the ligand binding, ion channel or other activity of intact ABBP subtypes. The ABBP alphal and albha2 subunits can also be used to produce subunit peptides for use as immunogens for preparing antibodies to permit affinity purification of subtypes and their histological location

The invention in European a composition comprissing two or more isolated rac derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polymuclectide, a host cell comprising the vector, a method for identifying a nuclectide sequence which is differentially regulated in an animal subjected to pain and a composition of that increases or decreases the expression of the polymuclectide sequence that increases or decreases the expression of the polymuclectide sequence that is differentially expressed in neuronal tissue of a first animal composition of a polymuclectide sequence which regulates the expression of a polymuclectide sequence which regulates the expression of a polymuclectide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the composition, a method for identifying a polymuclectide sequence which is differentially expressed in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more of polypeptides or their antibodies. The polymuclectide or the compound that complete its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (SNI)) in an animal (e.g. gene therapy). The sequence presented is a rat protein (shown in Table 2 of injury (CCI) and spared nerve injury (SNI)) in an animal constriction the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed construction in the configuration which is differentially expressed during pain in the configuration in the configurati
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      10;

The invention discloses a composition comprising two or more isolated rate or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the movel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the composition, a method for producing a pharmaceutical composition, a method for identifying a compound useful in the activity in an animal of one or more of the polypeptides given in the activity in an animal of one or more of the polypeptides given in the activity in an animal of one or more of the polypeptides given in the activity in an animal of one or more of the polypeptides given in the polypeptide given the polypeptide given in the polypeptide given in the polypeptide given in the polypeptide given the polypeptide given in the polypeptide given procession of the pol
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        compound that

               The alphal subunit (AAW12368) and alpha2 subunit (AAW12369) amino acid sequences of chick neutronal alpha-bungarotoxin binding protein (ABBP) were deduced from newly isolated DNA molecules (AAT59196-97) obtd. from an 18-day chick embryo cDNA library. ABBP subunits can be produced in recombinant host cells, pref. a bacterium, and used in the screening of cholinergic agents and other drugs that may affect the ligand binding, ion channel or other activity of intact ABBP subtypes. The ABBP alphal as immunogens for preparing antibodies to produce subunit peptides for use subtypes and their histological location

The present sequence represents a human neuronal nicotinic acetylcholine receptor (NAChR) subunit. The cells expressing the alpha and/or beta NAChR subunits may be used in a method of screening compounds to identify any which modulate the activity of human neuronal NAChR. Subunit specific antibodies may be used to monitor the distribution and expression density of various subunits in normal vs diseased brain tissues. Testing of single receptor subunits or specific receptor subunit ombinations with a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       subtypes.

The alpha-7 subunit (AAW09025) of the human neuronal nicotinic acetylcholine receptor (nAcNR) can be expressed in transformed host cells carrying alpha-7 subunit DNA (see also AAT48299). Host cells, esp. mammalian cells or amphibian occytes, expressing the recombinant alpha-7 subunit, opt. in combination with other recombinant alpha and/or beta subunit, see also AAW09018-24, AAW09026-27), can be used to examine the function of human AChR and to identify cpds. that modulate its activity
                                                                                                                                                                                                                                  12

Human, alpha7 nicotinic acetylcholine gated ion channel; 5-hydroxytryptamine; 5-HT3; calcium ion conductance.

WO200073431-A2. Homo sapiens.

gated ion channel.

Wild-type human alpha7 ligand

(first entry)

14-MAR-2001

conserved throughout the various nach a sequence includes regions that are essential for ligand binding. The invention relates to water-soluble seasontial for ligand binding. The invention relates to water-soluble ligand-binding proteins derived from molluscs, especially acetylcholine-binding proteins (AChBBPs) and analogues of ligand-gated ion channels, the mater-soluble ligand-binding proteins are capable of coming multimers and are amenable to crystallization. The crystal commendation of a comming multimers and are amenable to crystallization. The crystal special proteins are capable of coming multimers and are amenable to crystallization. The crystal complete in provided, and can be used to generate 3D models of the extracellular ligand-binding domain of ligand-gated ion channels and thus for screening of drugs that act on these ion channels. Chimeric proteins are provided that are capable of binding a ligand of a ligand-gated receptor, and comprise at least the amino acids of the AChBP capable of binding a ligand of a ligand-determining solubility of the AChBP, in the same positions as in the determining solubility of the AChBP, in the same positions as in the chimeric proteins, at least the amino acids of at least of the conserved regions of an nAChR have been substituted for the corresponding amino acids, and preferably entire stretches have been substituted. New drugs can be developed that selectivally intervene in neuronal signalling pathways, especially where the ligand-gated ion channel is the nAChR, and the related disorder is fourette's syndrome, and prefered disorder is fourette's syndrome, and sequely and addiction to nicotine or schizophrenia 

502 AA;

Special cell culture medium for treating cells and for inducing mammalian cell lines to conduct calcium ions, comprising specified concentrations of ions of sodium, calcium and potassium at specified pH.

The present sequence is wild-type human alpha7 nicotinic acetylcholine gated ion channel. The human alpha7 ion channel was used in the construction of an alpha7/5-hydroxytryptamine (5-HT3) chineric ligand gated ion channel (see AAC90382 and AAB50014). The alpha7/5-HT3 chimeric ion channel can be expressed by recombinant cells in the present invention, resulting in preferential calcium ion conductance by the cells ---HTCIKSSTEYELGLILKEIRFITDQLRK 723 305 GLSVVVTVIVLQYHHHDPDGGKMPKMTRVILLNWCAWFLRMKRPGEDKVRP-ACQHKQRR CSDISSERKHQILSDVELKERSSKSLLANVLDIDDDFRH----NCRPMTPGGTLPHNPAF 297 IYLNLSAK---VCLAGYHEKRLLHDLLDPYNTLERPVLNESDPLQLSFGLTLMQIIDVDE 8 VWLALAASLLHVSLOGEFORKLYKELVKNYNPLERPVANDSOPLTVYFSLSLLQIMDVDE TNVLVNSSGHCQYLPPGIFKSSCYIDVRWFPFDVQHCKLKFGSWSYGGWSLDLQMQE---245 SALALLVFLLPADSGEKISLGITVLLSLTVFWLLVAEIMPATSDSVPLIAQYFASTMIIV KNOLLVTNVWLKLEWNDMNLRWNTSDYGGVKDLRIPPHRIWKPDVLMYNSADEGFDGTYQ TNVVVRNNGSCLYVPPGIFKSTCKIDITWFPFDDQRCEMKFGSWTYDGFQLDLQLQDETG GDISSYVLNGEWELLGVPGKRNEIYYNCCPEPYIDITFAIIIRRRTLYYFFNLIIPCVLI --WIRIVELCWLPWILRMSRPG----RPLILEFPTTP Gaps 91; DB 4; Length 502; 364 CSLASVE-----MSAVAPPPASNGNLLY-----IGFRGLDGVHCVP-TP-534 ASMALLGFTLPPDSGEKLSLGVTILLSLTVFLNMVAETMPATSDAVPL-Indels / Match 28.7%; Score 1159.5; DB 4; Local Similarity 45.1%; Pred. The invention relates to a method for identifying compounds that are antagonists or agonists of human neuronal nicotinic acetylcholine receptors (nNAChRs), by contacting recombinant cells with a test compound and measuring ion flux, the electrophysiological response of the cells or binding of the test compound to the nNAChR. The recombinant cells are produced by transfection with a nucleic acid encoding at least one human nNAChR (alpha or beta) subunit, such that the cells express an nNAChR comprising one human encoded by the transfected nucleic acid. This sequence represents the alpha 7 subunit of the human nNAChR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       297 IYLNISAK---VCLAGYHEKRLLHDLLDPYNTLERPYLNESDPLQLSFGLTLMQIIDVDE 353

AF143846 3629 bp mRNA linear INV 27-WAY-1999 Heliothis virescens putative nicotinic acetylcholine receptor alpha AF143846 GI:4895004

LOCUS DEFINITION

AF143846

ACCESSION VERSION

```
Heliothis virescens
Eukaryota; Metazoa; Arthropoda; Hexapoda; Insecta; Pterygota;
Eukaryota; Metazoa; Arthropoda; Hesinoptera; Glossata; Ditrysia;
Noctucidea; Noctuidae; Heliothinae; Heliothis.
1 (Bases 1 to 3629)
Schulte, T., Oelleers, N. and Adamczewski, M.
Putative alpha subunits of insect nicotinic acetylcholine receptors
more similar to vertebrate alpha 7 subunits and C. elegans Cezi
than to other insect nicotinic acetylcholine receptor alpha
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     /translation="MGGRARRSHLAAPAGLLLLCLLMPRGARCGYHEKRLLHHLLDH
